

OE Sales Order Verify / Ship Solution (Wireless) for Sage BusinessWorks

No more **WRONG**
parts being sent to the
RIGHT customer!

The C&A OE Sales Order Verify Ship Solution (*Wireless*) is designed to reduce labor cost and increase accuracy during the process of packaging parts (or loading trucks) for shipment. This solution forces the operator to scan each part being packaged. This scan is instantly verified against the Sales Order. If a wrong part is scanned the screen will turn RED and the operator will not be able to continue until the error is corrected. This is a very powerful solution to solving the problem of shipping the *wrong product to the right customer*.

Typical Procedure

- The Pick List is modified to have a bar code for both the Customer ID and the Sales Order number on it.
- Before an operator starts to pack a box they will scan the Customer ID and Sales Order number. This will bring up a screen showing a few of the line items of the sales order with an additional column to show the number shipped.
- While picking the items the operator will scan each item as it goes into the pick basket or loaded on the truck. If the scanned bar code does not exist on the sales order then the computer will BEEP and the screen will go red. At this time the operator must clear the error before they can continue.
- When the entire sales order has been picked or loaded the program will print a picking / shipping report of what was packed for the front office. The report will either show "Picked / Shipped as Ordered" or "Picked / Shipped with the following items shorted."
